

# Regular expressions

Character	BRE / ERE	Meaning in a pattern
\	Both	Usually, turn off the special meaning of the following character. Occasionally, enable a special meaning for the following character, such as for <code>\(...\)</code> and <code>\{...\}</code> .
.	Both	Match any single character except NULL. Individual programs may also disallow matching newline.
*	Both	Match any number (or none) of the single character that immediately precedes it. For EREs, the preceding character can instead be a regular expression. For example, since <code>.</code> (dot) means any character, <code>.*</code> means "match any number of any character." For BREs, <code>*</code> is not special if it's the first character of a regular expression.
^	Both	Match the following regular expression at the beginning of the line or string. BRE: special only at the beginning of a regular expression. ERE: special everywhere.

# Regular Expressions (cont'd)

\$	Both	Match the preceding regular expression at the end of the line or string. BRE: special only at the end of a regular expression. ERE: special everywhere.
[...]	Both	Termed a bracket expression, this matches any one of the enclosed characters. A hyphen (-) indicates a range of consecutive characters. (Caution: ranges are locale-sensitive, and thus not portable.) <b>A circumflex (^) as the first character in the brackets reverses the sense: it matches any one character not in the list.</b> A hyphen or close bracket (]) as the first character is treated as a member of the list. All other metacharacters are treated as members of the list (i.e., literally). Bracket expressions may contain collating symbols, equivalence classes, and character classes (described shortly).
\{n,m\}	BRE	Termed an <i>interval expression</i> , this matches a range of occurrences of the single character that immediately precedes it. \{n\} matches exactly n occurrences, \{n,\} matches at least n occurrences, and \{n,m\} matches any number of occurrences between n and m. n and m must be between 0 and RE_DUP_MAX (minimum value: 255), inclusive.
\( \)	BRE	Save the pattern enclosed between \( and \) in a special <i>holding space</i> . Up to nine sub patterns can be saved on a single pattern. The text matched by the sub patterns can be reused later in the same pattern, by the escape sequences \1 to \9. For example, \(ab\).*\1 matches two occurrences of ab, with any number of characters in between.

# Regular Expressions (cont'd)

<code>\n</code>	BRE	Replay the nth subpattern enclosed in <code>\(</code> and <code>\)</code> into the pattern at this point. n is a number from 1 to 9, with 1 starting on the left.
<code>{n,m}</code>	ERE	Just like the BRE <code>\{n,m\}</code> earlier, but without the backslashes in front of the braces.
<code>+</code>	ERE	Match one or more instances of the preceding regular expression.
<code>?</code>	ERE	Match zero or one instances of the preceding regular expression.
<code> </code>	ERE	Match the regular expression specified before or after.
<code>()</code>	ERE	Apply a match to the enclosed group of regular expressions.

# Regular Expressions (cont'd)

$*$	Match zero or more of the preceding character
$\{n\}$	Exactly n occurrences of the preceding regular expression
$\{n,\}$	At least n occurrences of the preceding regular expression
$\{n,m\}$	Between n and m occurrences of the preceding regular expression

# POSIX Bracket Expressions

Class	Matching characters	Class	Matching characters
<code>[[:alnum:]]</code>	Alphanumeric characters	<code>[[:lower:]]</code>	<b>Lowercase characters</b>
<code>[[:alpha:]]</code>	Alphabetic characters	<code>[[:print:]]</code>	Printable characters
<code>[[:blank:]]</code>	<b>Space and tab characters</b>	<code>[[:punct:]]</code>	Punctuation characters
<code>[[:cntrl:]]</code>	Control characters	<code>[[:space:]]</code>	Whitespace characters
<code>[[:digit:]]</code>	Numeric characters	<code>[[:upper:]]</code>	<b>Uppercase characters</b>
<code>[[:graph:]]</code>	Nonspace characters	<code>[[:ascii:]]</code>	<b>ASCII Characters</b>
